GENERAL DATA

Electrical:
Heater, for Unipotential Cathode:
  Voltage .............. 6.3 ± 10%* ...... ac or dc volts
  Current .............. 0.6 .............. amp
Cathode:
  Minimum heating time prior to tube conduction .................. 20 sec
Direct Interelectrode Capacitances  
  (Approx.): 0°
  Grid No.1 to anode .............. 0.026 μf
  Grid No.1 to cathode, grid No.2, and heater .............. 2.4 μf
  Anode to cathode, grid No.2, and heater .............. 1.6 μf
Ionization Time (Approx.):
  For dc anode volts = 100, grid-No.1 volts (square-wave pulse) = 50, peak anode amperes during conduction = 0.5 .............. 0.5 μsec
Deionization Time (Approx.):
  For dc anode volts = 125, dc anode amperes = 0.1, grid-No.1 resistor (ohms) = 1000, and grid-No.1 volts = -100 .............. 35 μsec
  For dc anode volts = 125, dc anode amperes = 0.1, grid-No.1 resistor (ohms) = 1000, and grid-No.1 volts = -10 .............. 75 μsec
Maximum Critical Grid-No.1 Current:
  For anode-supply volts (rms) = 460, and average anode amperes = 0.1 .............. 0.5 μa
Anode Voltage Drop (Approx.): .............. 8 volts
Grid-No.1 Control Ratio (Approx.)
  with grid-No.1 resistor (megohms) = 0, grid-No.2 volts = 0 .............. 250
Grid-No.2 Control Ratio (Approx.)
  with grid-No.1 resistor (megohms) = 0, grid-No.2 resistor (megohms) = 0, grid-No.1 volts = 0 .............. 1000

Mechanical:
Operating Position: .................................................. Any
Maximum Overall Length: ...................... 2-1/8"
Maximum Seated Length: ...................... 1-7/8"
Length, Base Seat to Bulb Top (Excluding tip): 1-1/2" ± 3/32"
Maximum Diameter: ................................. 3/4"
Dimensional Outline: See General Section
Bulb: ............................................................. T5-1/2
Base: .................................................. Small-Button Miniature 7-Pin (JETEC No.E7-1)

* 0°: See next page.
GAS THYRATRON

RELAY AND GRID-CONTROLLED RECTIFIER SERVICE

Maximum and Minimum Ratings, Absolute Values:
For anode-supply frequency of 60 cps

PEAK ANODE VOLTAGE:
Forward ........................................ 650 max. volts
Inverse .......................................... 1300 max. volts

GRID-No.2 (SHIELD-GRID) VOLTAGE:
Peak, before tube conduction ................ -100 max. volts
Average®, during tube conduction ........... -10 max. volts

GRID-No.1 (CONTROL-GRID) VOLTAGE:
Peak, before tube conduction ................ -100 max. volts
Average®, during tube conduction ........... -10 max. volts

CATHODE CURRENT:
Peak ................................................ 0.5 max. amp
Average® ........................................... 0.1 max. amp
Fault, for duration of 0.1 second max. .. 10 max. amp

GRID-No.2 CURRENT:
Average® ........................................... +0.01 max. amp

GRID-No.1 CURRENT:
Average® ........................................... +0.01 max. amp

PEAK HEATER-CATHODE VOLTAGE:
Heater negative with respect to cathode 100 max. volts
Heater positive with respect to cathode 25 max. volts

BULB TEMPERATURE (At hottest point)
on bulb surface .................................. 150 max. °C

AMBIENT TEMPERATURE .......................... -75 min. °C

Typical Operation for Relay Service:

RMS Anode Voltage .............................. 117 400 volts
Grid-No.2 Voltage .............................. 0 0 volts
RMS Grid-No.1 Bias Voltage® .................. 5 - volts
DC Grid-No.1 Bias Voltage ..................... - -6 volts
Peak Grid-No.1 Signal Voltage ............... 5 6 volts
Grid-No.1-Circuit Resistance ................ 1 1 megohm
Anode-Circuit Resistance® .................. 1200 2000 ohms

Maximum Circuit Values:
Grid-No.1-Circuit Resistance ................ 10 max. megohms

®,®,®,®,#: See next page.
PULSE-MODULATOR SERVICE

For rectangular-wave shapes, duty cycle of 0.001 max., pulse duration of 5 \( \mu \) sec. max., and pulse-repetition rate of 500 pps max.

Maximum and Minimum Ratings, Absolute Values:

PEAK ANODE VOLTAGE:
- Forward .................. 500 max. volts
- Inverse .................... 100 max. volts

GRID-No.2 (SHIELD-GRID) VOLTAGE:
- Peak, before tube conduction .......... -50 max. volts
- Average, during tube conduction ...... -10 max. volts

GRID-No.1 (CONTROL-GRID) VOLTAGE:
- Peak, before tube conduction .......... -100 max. volts
- Average, during tube conduction ...... -10 max. volts

CATHODE CURRENT:
- Peak .................................. 10 max. amp
- Average ............................... 0.01 max. amp
- Rate of change ....................... 100 max. amp/\mu sec

PEAK GRID-No.2 CURRENT ...................... 0.02 max. amp
PEAK GRID-No.1 CURRENT ...................... 0.02 max. amp

PEAK HEATER-CATHODE VOLTAGE:
- Heater negative with respect to cathode 0 max. volts
- Heater positive with respect to cathode 0 max. volts

BULB TEMPERATURE (At hottest point on bulb surface) ....................... 150 max. \( ^\circ C \)

AMBIENT TEMPERATURE ....................... -75 min. \( ^\circ C \)

Maximum and Minimum Circuit Values:

Grid-No.1 Circuit Resistance .......... 0.5 max. megohm
Grid-No.2 Circuit Resistance .......... 25000 max. ohms

Characteristics Range Values for Equipment Design

Note 1: With 6.3 volts ac or dc on heater.
Note 2: With anode-supply volts (rms) = 460, grid-No.2 volts = 0, load resistor (ohms) = 3000, and grid-No.1 resistor (megohms) = 0.1.
Note 3: With anode-supply volts (rms) = 460, grid-No.2 volts = 0, load resistor (ohms) = 3000, and grid-No.1 resistor (megohms) = 10.
Note 4: With 7.0 volts ac or dc on heater.
Note 5: With grid-No.2 volts = 0, grid-No.1 volts = 0, load resistor (ohms) = 1000, and grid-No.1 resistor (megohms) = 0.1.
Note 6: With 5.7 volts ac or dc on heater.
Note 7: With 0 volts on heater.
Note 8: With grid-No.1 volts = -100, grid-No.2 volts = 0, and load resistor (ohms) = 10000.
Note 9: With anode-supply volts (rms) = 150, grid-No.1 supply volts (rms and in phase with anode-supply voltage) = 16.
Note 10: With grid-No.2 volts = ±380 with respect to anode and all other electrodes floating.

* For pulse-modulator service, tolerance is +10%, -5%.
○ Without external shield.
■ Averaged over any interval of 30 seconds maximum.
□ Approximately 180° out of phase with the anode voltage.
# Sufficient resistance, including the tube load, must be used under any conditions of operation to prevent exceeding the current ratings.

SPECIAL RATINGS AND PERFORMANCE DATA

Shock Rating:
Impact Acceleration | 750 max. g |
This test is performed on a sample lot of tubes from each production run. Tubes are held rigid and are tested in...
four different positions. At the end of this test, tubes will not show permanent or temporary shorts or open circuits, and are required to meet established limits for heater-cathode leakage current, grid-No.1 supply voltage for tube conduction (I) and anode-supply voltage for tube conduction (I).

Fatigue Rating:

Vibrational Acceleration. . . . . . 2.5 max. g
This test is performed on a sample lot of tubes from each production run. Tubes are rigidly mounted and subjected in each of three positions to 2.5 g vibrational acceleration at 60 cycles per second for 32 hours. At the end of this test, tubes will not show permanent or temporary shorts or open circuits, and are required to meet established limits for heater-cathode leakage current, grid-No.1 supply voltage for tube conduction (I) and anode-supply voltage for tube conduction (I).

Heater-Cycling Life Performance:

Cycles of Intermittent Operation. . . . 2000 min. cycles
Under the following conditions: Heater volts = 7.5 cycled one minute on and one minute off, heater 100 volts negative with respect to cathode, and all other elements connected to ground.

Shorts and Continuity Test:

This test is performed on a sample lot of tubes from each production run. In this test a tube is considered inoperative if it shows a permanent or temporary short or open circuit.

1-Hour Stability Life Performance:

This test is performed on a sample lot of tubes from each production run to insure that tubes have been properly stabilized. Conditions of life testing are specified under 500-hour intermittent life performance, except test run at room temperature. Tubes are initially read for grid-No.1 supply voltage for tube conduction (I). At the end of 1 hour, grid-No.1 supply voltage is read. The variation in the 0-hour and 1-hour readings will not exceed 15 per cent. Tubes must also meet established limits of grid-No.1 supply voltage.

100-Hour Survival Life Performance:

This test is performed on a sample lot of tubes from each production run to insure a low percentage of early inoperatives. Conditions of life testing are specified under 500-hour intermittent life performance, except test run at room temperature. At the end of 100 hours, a tube is considered inoperative if it shows a permanent or
temporary short or open circuit or fails to meet established limits of grid-No.1 supply voltage for tube conduction (I).

**500-Hour Intermittent Life Performance:**

This test is performed on a sample lot of tubes from each production run to insure high quality of the individual tube and to guard against epidemic failures of any of the characteristics indicated below. Life testing is conducted under the following conditions: Heater volts = 6.3, anode-supply volts (rms) = 460, grid-No.2 supply volts = 0, average anode milliamperes = 80, peak anode milliamperes = 500, grid-No.1 resistor (ohms) = 50000, and minimum bulb temperature (°C) = 150. At the end of 500 hours, tube will not show permanent shorts or open circuits and will be criticized for the total number of defects in the sample lot and for the number of tubes failing to pass established initial limits of heater current, grid-No.1 supply voltage (I), and 500-hour limits for anode-supply voltage (I), heater-cathode leakage current, and leakage resistance shown under CHARACTERISTICS RANGE VALUES.

**OPERATING CONSIDERATIONS**

Sufficient anode-circuit resistance, including the tube load, must be used under any conditions of operation to prevent exceeding the current ratings of the tube.

Curves shown under Type 2D21 also apply to the 5727
