Abstract

We use the recent findings of Cohl [arXiv:1105.2735] and evaluate two integrals involving the Gegenbauer polynomials: $\int_{-1}^x dt (1-t^2)^{\lambda-1/2} (x-t)^{-\kappa-1/2} C_n^\lambda(t)$ and $\int_x^1 dt (1-t^2)^{\lambda-1/2} (t-x)^{-\kappa-1/2} C_n^\lambda(t)$, both with $\operatorname{Re} \lambda > -\frac{1}{2}$, $\operatorname{Re} \kappa < \frac{1}{2}$, $-1 < x < 1$. The results are expressed in terms of the on-the-cut associated Legendre functions $P_{n+\lambda-1/2}^{\kappa-\lambda}(\pm x)$ and $Q_{n+\lambda-1/2}^{\kappa-\lambda}(x)$. In addition, we find closed-form representations of the series $\sum_{n=0}^{\infty} (\pm)^n [(n+\lambda)/\lambda] P_{n+\lambda-1/2}^{\kappa-\lambda}(\pm x) C_n^\lambda(t)$ and $\sum_{n=0}^{\infty} (\pm)^n [(n+\lambda)/\lambda] Q_{n+\lambda-1/2}^{\kappa-\lambda}(\pm x) C_n^\lambda(t)$, both with $\operatorname{Re} \lambda > -\frac{1}{2}$, $\operatorname{Re} \kappa < \frac{1}{2}$, $-1 < t < 1$, $-1 < x < 1$.

Key words: Special functions; Legendre functions; Gegenbauer polynomials; Fourier expansions

MSC2010: 33C55, 33C45, 33C05

1 Introduction

Recently, Cohl [1] has derived the integral formula

$$\frac{n+\lambda}{\lambda} \int_{-1}^1 dt \frac{(1-t^2)^{\lambda-1/2} C_n^\lambda(t)}{(z-t)^{\kappa+1/2}} = e^{i\pi(\lambda-\kappa)} \frac{\sqrt{\pi} (n+\lambda) \Gamma(n+2\lambda)}{2^{\lambda-3/2} n! \Gamma(\lambda+1) \Gamma(\kappa+\frac{1}{2})} (z^2-1)^{(\lambda-\kappa)/2} \mathfrak{Q}_{n+\lambda-1/2}^{\kappa-\lambda}(z) \quad (\operatorname{Re} \lambda > -\frac{1}{2}, \kappa \in \mathbb{C}, z \in \mathbb{C} \setminus (-\infty, 1]), \quad (1.1)$$

where $C_n^\lambda(t)$ is the Gegenbauer polynomial, while $\mathfrak{Q}_\nu^\mu(z)$ is the associated Legendre function of the second kind. The integral (1.1) generalizes the Gormley's result [2]

$$\frac{n+\lambda}{\lambda} \int_{-1}^1 dt \frac{(1-t^2)^{\lambda-1/2} C_n^\lambda(t)}{z-t} = e^{i\pi(\lambda-1/2)} \frac{\sqrt{\pi} (n+\lambda) \Gamma(n+2\lambda)}{2^{\lambda-3/2} n! \Gamma(\lambda+1)} (z^2-1)^{(\lambda-1/2)/2} \mathfrak{Q}_{n+\lambda-1/2}^{1/2-\lambda}(z) \quad (\operatorname{Re} \lambda > -\frac{1}{2}, z \in \mathbb{C} \setminus (-\infty, 1]), \quad (1.2)$$

which, in turn, is an extension of the celebrated Neumann's integral formula [3]

$$\int_{-1}^1 dt \frac{P_n(t)}{z-t} = 2\mathfrak{Q}_n(z) \quad (z \in \mathbb{C} \setminus [-1, 1]), \quad (1.3)$$

where $P_n(t)$ is the Legendre polynomial. The factor $(n+\lambda)/\lambda$ appearing in front of the integrals in Eqs. (1.1) and (1.2) (and also at some other places in the text) is only seemingly awkward and has been introduced to avoid the difficulty one otherwise encounters when $\lambda \rightarrow 0$.

From Eq. (1.1) and from the closure relation for the Gegenbauer polynomials, which is

$$\frac{2^{2\lambda-1}\Gamma^2(\lambda)}{\pi} \sum_{n=0}^{\infty} \frac{n!(n+\lambda)}{\Gamma(n+2\lambda)} C_n^\lambda(t) C_n^\lambda(t') = \frac{\delta(t-t')}{(1-t^2)^{(\lambda-1/2)/2} (1-t'^2)^{(\lambda-1/2)/2}} \quad (\text{Re } \lambda > -\frac{1}{2}, -1 < t, t' < 1) \quad (1.4)$$

(here $\delta(t-t')$ is the Dirac delta function), one may deduce the summation formula [1]

$$\sum_{n=0}^{\infty} \frac{n+\lambda}{\lambda} \mathfrak{Q}_{n+\lambda-1/2}^{\kappa-\lambda}(z) C_n^\lambda(t) = e^{i\pi(\kappa-\lambda)} \frac{\sqrt{\pi} \Gamma(\kappa + \frac{1}{2})}{2^{\lambda+1/2} \Gamma(\lambda+1)} \frac{(z^2-1)^{(\kappa-\lambda)/2}}{(z-t)^{\kappa+1/2}} \quad (\text{Re } \lambda > -\frac{1}{2}, \kappa \in \mathbb{C}, -1 < t < 1, z \in \mathbb{C} \setminus (-\infty, 1]). \quad (1.5)$$

The particular case of this relation with $\kappa = \lambda$ has been known before [4, p. 183]. For $\kappa = \lambda = 1/2$, Eq. (1.5) reduces to the Heine's identity

$$\sum_{n=0}^{\infty} (2n+1) \mathfrak{Q}_n(z) P_n(t) = \frac{1}{z-t}, \quad (-1 < t < 1, z \in \mathbb{C} \setminus (-\infty, 1]). \quad (1.6)$$

In Sec. 2 of this communication, we show that one may use the relation in Eq. (1.1) to evaluate some further definite integrals involving the Gegenbauer polynomials. Furthermore, in Sec. 3, we exploit the identity (1.5) to determine closed-form representations of some series involving the Gegenbauer polynomials and the associated Legendre functions on the cut. While particular cases of the relations we arrive at in the present work, corresponding to specific choices of the parameters λ and κ , may be found in the literature on special functions, we are not aware of any appearance of these relations in their most general forms derived below.

Throughout the paper, it is understood that

$$(z^2-1)^\alpha \equiv (z-1)^\alpha (z+1)^\alpha \quad (|\arg(z \pm 1)| < \pi). \quad (1.7)$$

2 Evaluation of some definite integrals involving the Gegenbauer polynomials

Let us assume that $\text{Re } \kappa < \frac{1}{2}$. We proceed to the investigation of the limit of the formula in Eq. (1.1) as $z \rightarrow x \pm i0$, with $-1 < x < 1$. Exploiting the identities

$$x \pm i0 + 1 = 1 + x, \quad x \pm i0 - 1 = e^{\pm i\pi} (1 - x) \quad (-1 < x < 1) \quad (2.1)$$

and

$$e^{-i\pi\mu} \mathfrak{Q}_\nu^\mu(x \pm i0) = e^{\pm i\pi\mu/2} \left[Q_\nu^\mu(x) \mp \frac{i\pi}{2} P_\nu^\mu(x) \right] \quad (-1 < x < 1), \quad (2.2)$$

where $P_\nu^\mu(x)$ and $Q_\nu^\mu(x)$ are the associated Legendre functions *on the cut*, we obtain

$$\begin{aligned} \frac{n+\lambda}{\lambda} \int_{-1}^1 dt \frac{(1-t^2)^{\lambda-1/2} C_n^\lambda(t)}{(x \pm i0 - t)^{\kappa+1/2}} &= \frac{\sqrt{\pi} (n+\lambda) \Gamma(n+2\lambda)}{2^{\lambda-3/2} n! \Gamma(\lambda+1) \Gamma(\kappa + \frac{1}{2})} \\ &\times (1-x^2)^{(\lambda-\kappa)/2} \left[Q_{n+\lambda-1/2}^{\kappa-\lambda}(x) \mp \frac{i\pi}{2} P_{n+\lambda-1/2}^{\kappa-\lambda}(x) \right] \\ &(\text{Re } \lambda > -\frac{1}{2}, \text{Re } \kappa < \frac{1}{2}, -1 < x < 1). \end{aligned} \quad (2.3)$$

(The reason for imposing the above constraint on κ is now clear: we have had to exclude a non-integrable singularity at $t = x$ that otherwise occurs.) Since it holds that

$$x \pm i0 - t = \begin{cases} x - t & (t < x) \\ e^{\pm i\pi} (t - x) & (t > x), \end{cases} \quad (2.4)$$

we may split the integrals appearing on the left-hand side of Eq. (2.3) as follows:

$$\begin{aligned} \frac{n+\lambda}{\lambda} \int_{-1}^1 dt \frac{(1-t^2)^{\lambda-1/2} C_n^\lambda(t)}{(x \pm i0 - t)^{\kappa+1/2}} &= \frac{n+\lambda}{\lambda} \int_{-1}^x dt \frac{(1-t^2)^{\lambda-1/2} C_n^\lambda(t)}{(x-t)^{\kappa+1/2}} \\ &+ e^{\mp i\pi(\kappa+1/2)} \frac{n+\lambda}{\lambda} \int_x^1 dt \frac{(1-t^2)^{\lambda-1/2} C_n^\lambda(t)}{(t-x)^{\kappa+1/2}} \\ &(\operatorname{Re} \lambda > -\frac{1}{2}, \operatorname{Re} \kappa < \frac{1}{2}, -1 < x < 1). \end{aligned} \quad (2.5)$$

If we insert Eq. (2.5) into Eq. (2.3), and then equate separately terms corresponding to the choices of the upper and the lower signs on both sides of the resulting equation, we arrive at an inhomogeneous algebraic system for the two integrals standing on the right-hand side of Eq. (2.5). Solving this system, and using the well-known identity

$$\Gamma(\zeta)\Gamma(1-\zeta) = \frac{\pi}{\sin(\pi\zeta)}, \quad (2.6)$$

we obtain

$$\begin{aligned} \frac{n+\lambda}{\lambda} \int_x^1 dt \frac{(1-t^2)^{\lambda-1/2} C_n^\lambda(t)}{(t-x)^{\kappa+1/2}} &= \frac{\sqrt{\pi}(n+\lambda)\Gamma(n+2\lambda)\Gamma(\frac{1}{2}-\kappa)}{2^{\lambda-1/2}n!\Gamma(\lambda+1)} (1-x^2)^{(\lambda-\kappa)/2} P_{n+\lambda-1/2}^{\kappa-\lambda}(x) \\ &(\operatorname{Re} \lambda > -\frac{1}{2}, \operatorname{Re} \kappa < \frac{1}{2}, -1 < x < 1) \end{aligned} \quad (2.7)$$

and

$$\begin{aligned} \frac{n+\lambda}{\lambda} \int_{-1}^x dt \frac{(1-t^2)^{\lambda-1/2} C_n^\lambda(t)}{(x-t)^{\kappa+1/2}} \\ &= \frac{\sqrt{\pi}(n+\lambda)\Gamma(n+2\lambda)}{2^{\lambda-3/2}n!\Gamma(\lambda+1)\Gamma(\kappa+\frac{1}{2})} (1-x^2)^{(\lambda-\kappa)/2} \left\{ Q_{n+\lambda-1/2}^{\kappa-\lambda}(x) - \frac{\pi}{2} P_{n+\lambda-1/2}^{\kappa-\lambda}(x) \cot[\pi(\kappa+\frac{1}{2})] \right\} \\ &(\operatorname{Re} \lambda > -\frac{1}{2}, \operatorname{Re} \kappa < \frac{1}{2}, -1 < x < 1), \end{aligned} \quad (2.8)$$

respectively. The right-hand side of the latter equation may be simplified considerably after one exploits the known relation¹

$$P_\nu^\mu(-x) = P_\nu^\mu(x) \cos[\pi(\nu+\mu)] - \frac{2}{\pi} Q_\nu^\mu(x) \sin[\pi(\nu+\mu)] \quad (-1 < x < 1) \quad (2.9)$$

and the identity (2.6). This yields

$$\begin{aligned} \frac{n+\lambda}{\lambda} \int_{-1}^x dt \frac{(1-t^2)^{\lambda-1/2} C_n^\lambda(t)}{(x-t)^{\kappa+1/2}} \\ &= (-)^n \frac{\sqrt{\pi}(n+\lambda)\Gamma(n+2\lambda)\Gamma(\frac{1}{2}-\kappa)}{2^{\lambda-1/2}n!\Gamma(\lambda+1)} (1-x^2)^{(\lambda-\kappa)/2} P_{n+\lambda-1/2}^{\kappa-\lambda}(-x) \\ &(\operatorname{Re} \lambda > -\frac{1}{2}, \operatorname{Re} \kappa < \frac{1}{2}, -1 < x < 1). \end{aligned} \quad (2.10)$$

Equation (2.10) may be also derived from Eq. (2.7) after in the latter one makes the simultaneous replacements $t \rightarrow -t$ and $x \rightarrow -x$, and subsequently exploits the property $C_n^\lambda(-t) = (-)^n C_n^\lambda(t)$.

Equations (2.7) and (2.10) constitute the result of this section. Their particular cases, corresponding to making the choices $\lambda = \frac{1}{2}$ and $\kappa = 0$, may be found, albeit with the right-hand sides written in less compact forms, in Refs. [4, p. 261] and [6, p. 187].

¹ It is stated in Refs. [4, p. 170] and [5, p. 144] that the domain of validity of the relation displayed in our Eq. (2.9), and also of the counterpart expression for $Q_\nu^\mu(-x)$ in terms of $P_\nu^\mu(x)$ and $Q_\nu^\mu(x)$, is $0 < x < 1$. However, it is not difficult to show that if both relations hold on that interval, they must be valid for $-1 < x \leq 0$ as well.

3 Evaluation of closed forms of some series involving the Gegenbauer polynomials and the associated Legendre functions on the cut

Next, we shall draw inferences from the expansion (1.5), approaching the limit $z \rightarrow x \pm i0$, with $-1 < x < 1$. As in the preceding section, we assume that $\text{Re } \kappa < \frac{1}{2}$ (recall that the formula in Eq. (1.5) is a consequence of Eq. (1.1) which in the limit discussed here loses its sense unless the above restriction is imposed on κ). With the use of Eqs. (2.1), (2.2) and (2.4), we arrive at

$$\begin{aligned} & \sum_{n=0}^{\infty} \frac{n+\lambda}{\lambda} \left[Q_{n+\lambda-1/2}^{\kappa-\lambda}(x) \mp \frac{i\pi}{2} P_{n+\lambda-1/2}^{\kappa-\lambda}(x) \right] C_n^\lambda(t) \\ &= \frac{\sqrt{\pi} \Gamma(\kappa + \frac{1}{2})}{2^{\lambda+1/2} \Gamma(\lambda+1)} (1-x^2)^{(\kappa-\lambda)/2} \times \begin{cases} (x-t)^{-\kappa-1/2} & (-1 < t < x < 1) \\ e^{\mp i\pi(\kappa+1/2)} (t-x)^{-\kappa-1/2} & (-1 < x < t < 1) \end{cases} \\ & \hspace{15em} (\text{Re } \lambda > -\frac{1}{2}, \text{Re } \kappa < \frac{1}{2}). \end{aligned} \quad (3.1)$$

Hence, subtracting or adding the two relations embodied in Eq. (3.1), we deduce that

$$\begin{aligned} & \sum_{n=0}^{\infty} \frac{n+\lambda}{\lambda} P_{n+\lambda-1/2}^{\kappa-\lambda}(x) C_n^\lambda(t) \\ &= \frac{\sqrt{\pi}}{2^{\lambda-1/2} \Gamma(\lambda+1) \Gamma(\frac{1}{2}-\kappa)} (1-x^2)^{(\kappa-\lambda)/2} \times \begin{cases} 0 & (-1 < t < x < 1) \\ (t-x)^{-\kappa-1/2} & (-1 < x < t < 1) \end{cases} \\ & \hspace{15em} (\text{Re } \lambda > -\frac{1}{2}, \text{Re } \kappa < \frac{1}{2}) \end{aligned} \quad (3.2)$$

and

$$\begin{aligned} & \sum_{n=0}^{\infty} \frac{n+\lambda}{\lambda} Q_{n+\lambda-1/2}^{\kappa-\lambda}(x) C_n^\lambda(t) \\ &= \frac{\sqrt{\pi} \Gamma(\kappa + \frac{1}{2})}{2^{\lambda+1/2} \Gamma(\lambda+1)} (1-x^2)^{(\kappa-\lambda)/2} \times \begin{cases} (x-t)^{-\kappa-1/2} & (-1 < t < x < 1) \\ (t-x)^{-\kappa-1/2} \cos[\pi(\kappa + \frac{1}{2})] & (-1 < x < t < 1) \end{cases} \\ & \hspace{15em} (\text{Re } \lambda > -\frac{1}{2}, \text{Re } \kappa < \frac{1}{2}). \end{aligned} \quad (3.3)$$

If in Eqs. (3.2) and (3.3) we make the simultaneous replacements $t \rightarrow -t$ and $x \rightarrow -x$, we obtain two further summation formulas:

$$\begin{aligned} & \sum_{n=0}^{\infty} (-)^n \frac{n+\lambda}{\lambda} P_{n+\lambda-1/2}^{\kappa-\lambda}(-x) C_n^\lambda(t) \\ &= \frac{\sqrt{\pi}}{2^{\lambda-1/2} \Gamma(\lambda+1) \Gamma(\frac{1}{2}-\kappa)} (1-x^2)^{(\kappa-\lambda)/2} \times \begin{cases} (x-t)^{-\kappa-1/2} & (-1 < t < x < 1) \\ 0 & (-1 < x < t < 1) \end{cases} \\ & \hspace{15em} (\text{Re } \lambda > -\frac{1}{2}, \text{Re } \kappa < \frac{1}{2}), \end{aligned} \quad (3.4)$$

$$\begin{aligned} & \sum_{n=0}^{\infty} (-)^n \frac{n+\lambda}{\lambda} Q_{n+\lambda-1/2}^{\kappa-\lambda}(-x) C_n^\lambda(t) \\ &= \frac{\sqrt{\pi} \Gamma(\kappa + \frac{1}{2})}{2^{\lambda+1/2} \Gamma(\lambda+1)} (1-x^2)^{(\kappa-\lambda)/2} \times \begin{cases} (x-t)^{-\kappa-1/2} \cos[\pi(\kappa + \frac{1}{2})] & (-1 < t < x < 1) \\ (t-x)^{-\kappa-1/2} & (-1 < x < t < 1) \end{cases} \\ & \hspace{15em} (\text{Re } \lambda > -\frac{1}{2}, \text{Re } \kappa < \frac{1}{2}). \end{aligned} \quad (3.5)$$

Some particular cases of the expansions (3.1)–(3.5), corresponding to specific choices of κ and/or λ , may be found² in Refs. [4, pp. 182–183], [5, p. 166] and [7, pp. 341–342].

² In the second series in Sec. 4.5.4 in Ref. [4, p. 182], $P_{m-1/2}^\mu(\cos \vartheta)$ should be replaced by $P_{m-1/2}^\mu(-\cos \vartheta)$. In the first formula in Ref. [4, p. 183], the constraint $x < \cos \varphi$ should be replaced by $-1 < \cos \varphi < x < 1$. Moreover, it follows from our Eq. (3.4) that the latter formula is valid at least for $\text{Re } \nu > -\frac{1}{2}$.

Acknowledgments

I thank Dr. Howard S. Cohl for drawing my attention to his work [1] and for a stimulating correspondence on the Legendre functions and related subjects.
